### MALARIA DAY (25.04.2023)

National Malaria Day is a day set aside to promote efforts to control and eradicate the disease as well as to increase awareness of the effects of malaria. The parasite that causes malaria is a dangerous sometimes fatal illness that infects people when infected mosquitoes bite them. It is a significant issue for public health in many regions of the world.

The 25th of April is celebrated as National Malaria Day every year. National Malaria Day has a distinct focus, but the objective is always the same: to support initiatives that aim to lessen the impact of malaria and stop its spread. Public awareness initiatives, educational initiatives, and community outreach initiatives are all carried out on this day. This day is also used by governments, NGOs, and other stakeholders to publicise new collaborations and efforts targeted at eradicating and controlling malaria.

The use of insecticide-treated bed nets, indoor residual spraying, quick identification and treatment of cases, and the creation of new tools and methods for malaria prevention and control are just a few of the many steps that must be taken in order to control and eradicate malaria. The necessity of continuing to invest in malaria control and prevention is underscored by National Malaria Day, which serves as a crucial reminder of the continuous need for these efforts. By this programme students are aware of insect-borne diseases.
